

March 2024 Release v2.25.0

New Features:

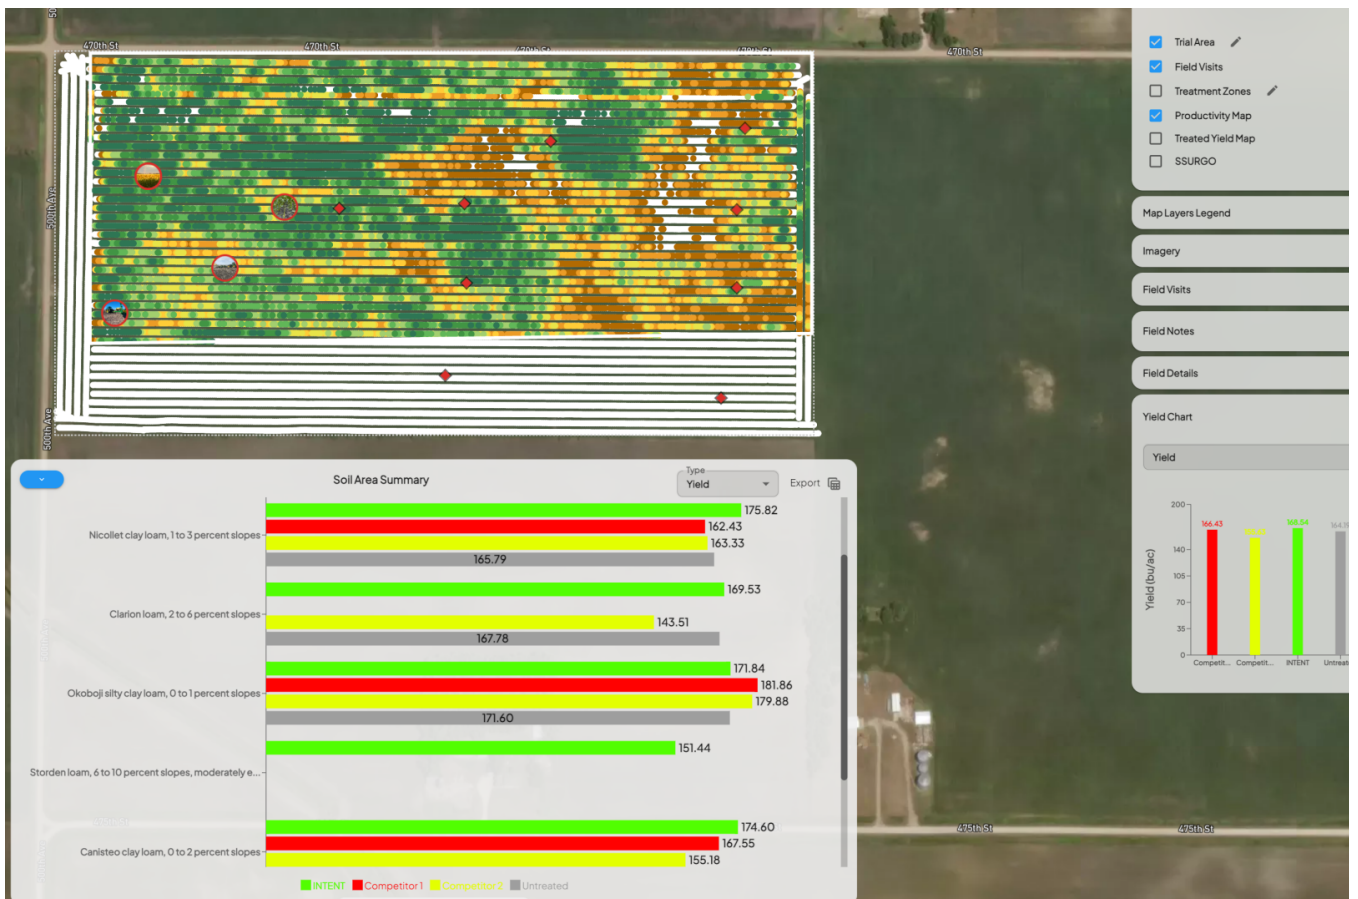

- **Superset in INVISION:** Customized Dashboards created in Superset can now be published & visualized in Insights without any code changes/deployment using Dashboard Management (admin tool available for super admins only). We're currently developing a prototype aggregate field visit and lab dashboard in Superset which will be published in Insights - INVISION Demo client, aimed at facilitating prospective client demonstrations.

- **International Metrics:** INVISION now supports additional metrics (Metric Tonnes, Imperial Tons, Pounds) by acres/hectares for yield measurement both for geospatial and manual harvest uploads. This can all be configured by crop in Protocol Management.
- **Standalone Standardize Machine Data:** Launched a standalone data converter tool in GIS Workstation that transforms raw files into SHP format (industry standard) without field or protocol restrictions, ideal for checking the raw file contents before protocol-field uploads.

Enhancements:

- **Soil Area Summary in View Fields:** Now featuring yield and moisture summaries by soil area directly in View Fields, without needing to load grower reports (PDFs).

- Growth Stages data added for Spring Wheat and Canola.

Revision #3
